

QuantumVet

If you are a horse or animal lover and you could heal your horse or pet, boost their immune system and improve their physical, emotional and mental well-being as well as their performance without drugs, invasive techniques or any stressful experiences, would you? Theresa Odendaal spoke to horsewoman, Riëtte van der Merwe, about the revolutionary SCIO Quantum Biofeedback Device and its use with horses and other animals.

Everything on earth consists of energy — every organism, be it human, animal, plant or mineral — even the air that we breathe. Every individual has his own unique energy vibration, almost like a fingerprint. A horse's vibration is different to that of a man or a cat, and one horse's vibration is different to that of another horse. This energy forms a shield around the body and flows in patterns, almost like electrical currents. When one of these energy streams is blocked, it is revealed in the body as a potential affliction. Just as a cut finger will heal, every cell, every organ in the body is programmed to heal itself and this will happen the moment these blockages are removed. This is something that has been proven scientifically and is the principle on which the SCIO system works.

The SCIO scans the vibrations of the individual, mapping the unique blueprint of the energy flow within the body. It picks up any imbalances or blockages in the energy pattern and strives to redress this balance through electromagnetic waves or currents. These imbalances can be due to disease, stress, injuries, allergies, trauma, etc, and by redressing this balance, it gives the body the chance to heal itself and is completely non-invasive.

In normal, mainstream medicine, the symptoms are often treated, but not the cause and the excess use of drugs can bring about further imbalances, creating a vicious cycle. This does not mean that normal mainstream medicine does not have its place, as indeed it does. The SCIO machine and Western traditional medicine can be used very effectively side by side, for instance in post-operative treatment to help the body heal faster and more effectively and to boost the immune system before surgery. The SCIO cannot heal broken bones then and there, but by giving the body the necessary help and stimulation, it will speed up the healing process and eliminate complications. i.e. SCIO will not offer a diagnosis: it may pick up the presence of parasites, a suppressed immune system, low liver function and reduced red blood cells. It will not call it biliary, for example, but will redress the balance nonetheless, enabling the body to effectively fight the disease and to start the healing process.

The SCIO machine uses technology employed by NASA to treat astronauts for any diseases or complaints developed in space. This technology was developed by Prof William Nelson. His book *The Promorpheus* was first registered by the library of Congress USA in 1982 and introduces the concepts of the SCIO, which is currently manufactured in Hungary.

The SCIO is used in two ways, the first being where the patient (human or horse) is connected to the machine, and the second where only hair from the patient is used and the healing done at a distance. This is possible because energy at the quantum level seeks to find the vibration that matches its own. Space and time are therefore of no consideration and as the matching vibration is located, the rebalancing

begins. This effectively means that if one had some hair from a particular horse, it could be treated instantly, anywhere in the world.

Spooky, you might say, but this may be explained through the world of quantum physics by Bell's theorem*, which was proposed in 1964 by Swiss physicist, J S Bell, and confirmed experimentally in 1972 by Prof John Clauser at Berkley, San Francisco. It shows us the bizarre nature of the subatomic world. If paired particles which are identical twins in their polarity fly apart, and the polarity of one is changed by an experimenter, the polarity of the other particle changes instantaneously.

It is as if these subatomic particles, such as electrons, are able to 'communicate' with each other, regardless of the distance separating them. It doesn't matter if they are 10 meters or 10 billion kilometers apart. This notion was also hinted at through mathematical reasoning in 1935 by Albert Einstein. This linkage of sub-atomic particles suggests a quantum field of connectivity that allows vibrational/energy effects to take place and instantaneously, regardless of distance on materials of the same frequency/energy pattern.

Even though a horse or human hair has many billions or trillions of atoms, and many more subatomic components, the idea is that, on average, hair from a particular individual will have a unique 'energy fingerprint' — much as it has a unique DNA pattern — that will distinguish it from the hair of any other creature. So the quantum energy effects input into the atoms and sub-atomic components of a hair would, in terms of this theory have the exact same effects on the other hair, and even the whole body, from which the sample/treatment hair was derived. Though still speculative, with some hard theoretical physics underpinnings supporting it, the empirical evidence strongly suggest that even though more work is needed to fully understand the process, something real and profound is happening. With many reports on the system's success, it is not surprising that it has been applied to animals.

Riëtte van der Merwe has always had an interest in all forms of healing. When she heard about the SCIO system, she decided to invest in one and use it on animals, horses in particular. The results were spectacular.

Her very first 'guinea pig' was her own horse, Rouge Royale. A couple of years ago he had biliary. To make matters worse, he had an acute reaction to the medicine used to treat it. The whole right hand side of his neck swelled up. It cost an absolute fortune to save the horse's life and he was left with severe nerve damage. All the muscles on his right-hand side became atrophied — as Riëtte says, her horse looked like a banana — and was virtually impossible to ride. He couldn't track through on the right and would 'freak out' when she tried to canter. She spent thousands on vets, acupuncturists, chiropractors and physiotherapists. He would be better for a few days, but was soon impossible again.

The morning after his first SCIO treatment, the horse was quiet to ride and moved forward without complaint. At first Riëtte thought she was hallucinating, but after two more treatments, the difference in the horse was visible to the naked eye and his behavior dramatically changed. Now, after six months and a total of seven treatments, the horse is 100%.

Riëtte has treated many horses (and other animals) to date for various illnesses, injuries and complaints, some as far afield as the UK and has had great successes. However, the SCIO system not only addresses physical issues, but also psychological and emotional imbalances. She has had many owners telling her that their horses and pets had undergone a complete personality change after the treatment. This is because many times, a person experiences a horse or a pet as merely difficult, not being aware that there

may be a physical, hormonal, psychological or emotional cause for the behavior and the moment this imbalance is corrected, the animal can be its real self.

A client had bought a new horse for her daughter. Soon the horse became almost unrideable and a danger to handle. The SCIO device pointed out that the horse's testosterone levels were far too high — due to the administration of an external steroid. Unknown to the buyers, the seller had given the horse a steroid to enhance his appearance and condition in order to sell him. After treatment, the horse reverted back to his normal gentle nature and the daughter was able to ride him with safety.

Another very interesting case concerned a little monkey. In an accident it became paralysed from the waist down. After extensive tests, nobody could determine the nature of the injury, as there did not seem to be any spinal cord injury, and yet he had no movement or feeling in those limbs. The owner brought Riëtte some of the monkey's hair and she promised to put this on the machine that evening. The next morning the owner phoned to say that she had been sitting in front of the TV with the little chap on her lap the previous evening, when suddenly he looked down at his legs with an expression of utter surprise. He then started scratching vigorously at his legs, as if they were itchy. One more distance treatment, followed by one attached to the machine, and the little chap is back to normal.

The SCIO system can also be used before competitions to enhance both horse and rider's performances, improving stamina, oxygen use, energy levels, blood flow and circulation, muscle strength and much more. Riëtte has used this on, among others, event riders Paul Hart and Wiseguy, Cindy de Villiers and Dickens and show jumper Kelly O'Connor and William, and in each and every case the pair performed faultlessly, winning their classes with the riders commenting that the horses had never felt better.

As a trial for the interview, I took some hair to Riëtte from my own horse. He is an 18-year-old thoroughbred and is, as far as I know, in good health. What came up on the system was really interesting though. It immediately pointed out that he tends to be quite highly strung (spot on) and showed up some of his past injuries and that he is prone to tendon and ligament injuries — something I am only too aware of. It even picked up his one slightly misaligned vertebra, not as a problem, just that it is there.

As we had been having an extremely hot spell, the horse was suffering a little from sunstroke and had a slight soreness in his neck on the left hand side — where I know another horse had bitten him and the muscle must have been bruised. The SCIO also picked up something very strange — the horse had small quantities of lead in his system. I cannot for the life of me imagine where he might have ingested this, but lead poisoning is very serious. There were also some slight chemical imbalances in the body, which may be attributed to this.

I had noticed that his coat had become a little rough and dull and his hooves brittle of late, but assumed that this was due to his age, but now I wonder if this may not have been caused by the lead in his system. Fortunately, apart from that and minor wear and tear, he is an unusually healthy and well-preserved 18-year-old. Riëtte then redressed the balances in the body and within a few days, his coat looked smoother and shinier and he was full of naughtiness — obviously feeling very good indeed.
